Post Meta

Advanced

Search in the following post types:

☐ Beiträge

☐ Seiten

☐ Medien

☐ Individuelles CSS

☐ Änderungs-Sets

☐ oEmbed-Antworten

☐ Benutzer-Anfragen

☐ Blöcke

☐ Feldgruppen

☐ Felder

☒ Werke/Bilder

☐ Künstler

Results per page:

60

Auto submit form?

☒

Field relationships:

AND

The relationship between tag, category, taxonomy & post meta (choice) fields

Enable Auto Count:

☒ Enable

Dynamically update the count number shown and also calculate which options to hide in your tag, category, taxonomy & post meta (choice) fields.

☒ Update the Search Form on user interaction

If disabled, the count numbers will only update when new results are loaded (ie, when the Search form is submitted)

Detect defaults from current page

When a Search Form is used on any page other than the Search Results Page, S&F will try to detect the post type and associated taxonomies of the current page - and set defaults in the Search Form to match these.

Choose which kinds of pages S&F will try to do this on:

☐ Post Type Archives

☐ Tag, Category & Taxonomy Archives

☐ Author Archives

5. Available Fields durch Drag & Drop anlegen

Available Fields

Drag any of these Available Fields in to the Search Form UI to start building your Search Form.

General Display Results Posts Tags, Categories & Taxonomies Post Meta Advanced

Display results method:

Using a Shortcode ▾

Place a results shortcode in any post or theme file to position where the results are displayed.

* You can find your results shortcode in the **Shortcodes** box on this page

[View the Shortcode setup instructions](#)

Template Options

Results URL: ⓘ

This should be the Full URL to a page/post where your results can be found - must contain the shortcode

Ajax

Load results using Ajax?

Make searches bookmarkable? ⓘ

Changes the URL in the address bar as the user searches.

Only use Ajax on the results page? ⓘ

If the user is not on the results page already, the first submit of the Search Form will cause a page redirect.

Scroll window to: ⓘ

▾

on

▾

Ajax Pagination

Pagination Type

▾

Setting up Infinite Scroll will require some knowledge of html/css - [read the guide here.](#)

Show loading icon? ⓘ

Post / Result Selector: ⓘ
(optional)

Rather than adding all the html content from a container, you can specify a css selector to target only elements that are results - eg - `article` or `div.post`

Infinite Scroll Container: ⓘ
(optional)

The infinite scroll container should only contain the posts/results themselves, no pagination or other result related data.

Infinite Scroll Trigger: ⓘ

px

When loading more results, S&F uses the bottom of Ajax Container (or Infinite Scroll container) to determine when the user has reached the bottom of the results.

Choose an offset in pixels from this point to activate infinite scroll.
